

AQUAREG ChromTri

BATH RECOVERY FOR TRIVALENT CHROME COATING

Equipment for the selective cleaning of the chrome coating bath, i.e. removing ballast metals and keeping their concentrations below critical values.

The device prevents the increase in the concentration of foreign unwanted metals (copper, nickel, zinc, iron, etc.), which occurs due to transfer from previous operations, dissolution of base material and excluded coatings prior to chrome coating, or parts dropped from the racks into the chrome coating bath.

AQUAREG ChromTri

- > for sulphate and chloride baths
- > for temperature up to 65°C
- > single (1 column) or duplex (2 columns - one in operation, the other recovering)
- > operation in bypass to the chrome tank without interrupting the chrome tank operation
- > equipped with a system to minimize bath losses during recovery
- > compact device installed on the frame
- > manual or automatic control
- > automatically controlled types: minimum operator requirements, touch panel control

Benefits of recovery

- > keeping ballast metal concentrations below limit values
- > stable appearance and other properties of the chrome coating
